
Quantum Mechanics Lesson 2: Particle Properties of Light

The Photoelectric Effect

Sherry Franklin, Chris Yohn
Published by *K20 Center*

Grade Level	11th – 12th Grade	**Duration**	3 days
Subject	Science		
Course	Physics		

Essential Question

Is light a wave or a particle?

Summary

Students investigate the particle properties of waves by discharging electroscopes and take notes using the Cornell Note System. The teacher performs a demonstration of discharging an electroscope with light. The students investigate the photoelectric effect using a simulation. Then using the Cornell Note System students explore Rogentgen's and Compton's experiments. Students use the 3-2-1 strategy to share what they have learned about the particle properties of light.

Snapshot

Engage

Students participate in two questions where they process different scenarios and discuss the difference between classical physics and quantum physics.

Explore

Students take notes using the Cornell Note System and focus on Max Planck's work, colors emitted by iron rods, and ultraviolet catastrophe.

Explain

The students observe a teacher demonstration for discharging an electroscope with UV light. They also participate in a PhET Photoelectric Effect simulation.

Extend

Students use the Cornell Note System to take notes about Roentgen's and Compton's experiment.

Evaluate

Students answer 3-2-1 prompts to show what they know about light having particle properties.

Standards

Next Generation Science Standards (Grade 3)

3-PS2-3: Ask questions to determine cause and effect relationships of electric or magnetic interactions between two objects not in contact with each other.

Next Generation Science Standards (Grade 3)

HS-PS4-1: Use mathematical representations to support a claim regarding relationships among the frequency, wavelength, and speed of waves traveling in various media.
HS-PS4-3: Evaluate the claims, evidence, and reasoning behind the idea that electromagnetic radiation can be described either by a wave model or a particle model, and that for some situations one model is more useful than the other.

Oklahoma Academic Standards (Physical Science)

PS.PS3.3 : Design, build, and refine a device that works within given constraints to convert one form of energy into another form of energy.*

Materials

- Lesson Slides (attached)
- Electroscope Investigation handout (attached, optional)
- Teacher Demonstration Discharging an Electroscope with UV light handout (attached, optional)
- PhET Simulation Photoelectric Effect handout (attached, one per student)
- PhET Simulation Photoelectric Effect Teacher’s Guide handout (attached, optional)
- Class set of electroscopes with rods and clothes and static tubes (Optional)
- Teacher Demonstration:
    - Red laser
    - Green laser (optional)
    - UV light source 254 nm
    - Electroscope with zinc disk on top
    - Rubber rod
    - Wool cloth
- Access to computers or computer lab
- Science Notebooks
- Paper (optional, multiple pages per student)
- Optional Student Electroscopy Activity
    - Static tube
    - Electroscope
    - Ebony (or pvc) rod
    - Acrylic rod
    - Wool cloth
    - Silk cloth

- Balloon (one per group, optional)
- Cloth (one per group, optional)

15 minutes

Engage

Use the attached **Lesson slides** to present the lesson.

Display **slides 3-4** to introduce the essential question and learning objectives to the class.

Display **slide 5** and introduce the thought questions to the class. Inform them you will show them two different scenarios. They will take some time to think about the questions, discuss it with those sitting around them, and then discuss it as a whole class. Students can use their Science Notebooks or notebook paper to work out the questions or record their thoughts. Read over the thought questions on the slide. Provide students with time to think about the two questions and discuss it with their neighbors. Ask for volunteers to discuss their thoughts and answers.

Display **slide 6** and discuss with the class the difference between classical physics thinking and quantum physics thinking.

Display **slide 7** and present the second thought question to the class. Provide students with time to think about the question. Ask for volunteers to discuss their thoughts and answers. Display **slide 8** and provide students with a second question to consider.

Possible Student Responses:

Slide 5: The volumes that can be added with the ice cubes are 10, 20, 30, 40, 50, 60, 70, 80, 90 and 100 or ten volumes which can be found by dividing 100/10=10

Slide 6: Using the 0.01 ml drops: 100/0.01=10,000 different volumes.

Slide 7: Using 1 molecule at a time 100ml/(1g/ml)=100g; 100g/(18.02g/mol)=5.55 mol

5.5 mol x 6.022x10^23=3.34x10^24 molecules

Display **slide 9** and discuss with the class the difference between classical physics thinking and quantum physics thinking.

Teacher's Note

Students may use the same paper to record observations and answer questions through the Explore phase.

20 minutes

Explore

Display **slide 10** and introduce the class to the Cornell Notes System instructional strategy. Have students draw the image (an upside-down T) from the slide on a blank page in their Science Notebook. Let the students know that they will want to leave two-three blank pages after their first diagram for more Cornell Notes later in the lesson.

Display **slide 11** and have students fill in the right side of their Cornell Notes focusing on the big ideas from the information from the following slides. Introduce students to Max Planck's Quantum Theory.

Inform students that a description of Planck's work with blackbody radiation will be presented. Students should define a blackbody and give an example in their notes.

Display **slide 12** and discuss colors of light emitted by iron rod. Students should note that objects emit light of greater intensity as their temperature increases.

Embedded video

https://youtube.com/watch?v=1wMoR2y01Nw

Display **slide 16** and show the video, **Planck's Constant and the Origin of Quantum Mechanics**. Start the video at the 3:04 mark and stop the video at 10:15 minutes.

Have students skip two-three pages in their Science Notebooks for further notes in the Extend section.

Display **slide 17** and have students look over their notes. Have students write down the key concepts they learned from the last few slides. Once they have recorded their key concepts, have them write 2-3 sentences summarizing what they have learned. Ask for a few volunteers to share their summaries.

55 minutes

Explain

Teacher's Note: Optional Electroscope Activity

Consider having the students complete the electroscope activity before your demonstration.

If you would like students to perform the electroscope charging part of the demonstration as a class activity unhide **slide 18**.

Follow the activity direction on the slide and here in the narrative.

Provide each pair of students with the following materials.

- Static tube
- Electroscope
- Ebony (or pvc) rod
- Lucite rod
- Wool cloth
- Silk cloth
- **Electroscope Investigation** handout

You can make static tubes by adding styrofoam filling into empty dry water bottles. You may have different types of rods and cloths. As long as they can produce both positive and negative charge, you may use any available. You can rub a balloon on cloth to create a negative charge.

Students will investigate electroscopes and how they work. They will charge an electroscope with negative charge. Then discharge the electroscope with their finger. Students will charge the electroscope with positive charge and discharge with their finger. Allow 15-20 minutes.

When students are finished, have them answer the post lab questions on a piece of paper or in their Science Notebooks.

Show the video, **Opposites Attract - Static Electricity**, of a homemade static tube. Have students complete the video questions.

Embedded video

https://youtube.com/watch?v=l5JjkoDyHlM

15 minutes

Extend

Have students get their Science Notebooks back out and open to the extra pages by their Cornell notes. Show **slide 41** and remind students of the Cornell Note System. Have them draw a new diagram in their Science Notebook.

Display **slide 42** and present Einstein's experiment and ideas. Students should note that Einstein applied Planck's idea, the formula for photon energy and how the photoelectric effect demonstrates particle behavior, what a photon is and how classical wave theory was inconsistent with the observed effect.

Display **slide 43** and emphasize the points on the slide.

Day 3

Display **slide 44** and present Roentgen's experiment. Students should note the detail of the experiment and that it supported particle-like behavior.

Display **slide 45** and show the video **How Does an X-ray Tube Work**. Tell students this is similar to the device Roentgen used in his experiment.

Embedded video

https://youtube.com/watch?v=Bc0eOjWkxpU

Display **slide 48** and have students look over their notes. Have students write down the key concepts they learned from the last few slides. Once they have recorded their key concepts, have them write 2-3 sentences summarizing what they have learned. Ask for a few volunteers to share their summaries.

15 minutes

Evaluate

Display **slide 49** and introduce the students to the 3-2-1 instructional strategy. Inform the students that they will use this strategy to assess what they have learned throughout this lesson. Students will address the following concepts in their Science Notebooks or on a sheet of notebook paper.

3 -Statements showing what you learned about light having properties of particles.

2- Questions you have about light having properties of particles.

1- Thing you found most interesting about light having properties of particles.

Teacher's Note

You can use the 3-2-1 strategy as a way to assess what the students learned and what they might need to revisit.

Technology Alternative: 3-2-1

Consider using this strategy digital. Go to this link and follow the prompts to present in real time.
