<b>Grade Level</b>	3rd Grade	<b>Time Frame</b>	1-2 class period(s)
<b>Subject</b>	Mathematics	<b>Duration</b>	90 minutes
<b>Course</b>	Elementary Mathematics		

### Essential Question

How do we describe numbers smaller than one?

### Summary

In this lesson, students will use fraction strips to develop a definition of numerator and denominator and discover how we describe the numbers between zero and one or part of a whole. They will then extend their understanding of fractions by investigating how to describe part of a set using a sample of candy.

### Snapshot

#### Engage

Students will use measuring cups and number lines to think about the space between 0 and 1.

#### Explore

Students will use fraction strips to explore how parts make a whole.

#### Explain

The class will work together to develop definitions for "numerator" and "denominator."

#### Extend

Students will use candies to discuss how fractions can also represent parts of a set.

#### Evaluate

Students will add to their definitions of "numerator" and "denominator" based off the candy lab.

## Standards

*Oklahoma Academic Standards for Mathematics (Grade 3)*

**3.N.3.1:** Read and write fractions with words and symbols.

**3.N.3.2:** Construct fractions using length, set, and area models.

## Attachments

- [Fraction Strips.docx](#)
- [Fraction Strips.pdf](#)
- [What's Between Zero and One.docx](#)
- [What's Between Zero and One.pdf](#)

## Materials

- Fraction Strips (see attachments) and four colors of copy paper for printing
- What's Between Zero and One student handouts
- Number line
- Set of measuring cups
- Single-serving bags of multi-color candies (one bag per student)

# Engage

## Lesson Preparation

Before the lesson, print and cut out copies of the fraction strips from the attachments. Each pair of students will need one of each strip ( $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{6}$ , and blank). There are 12 strips printed per page.

Show students a number line. Ask, "Are there numbers between 0 and 1?" "How do we know?"

Show students a one-cup measuring cup. Using the [Think-Pair-Share](#) strategy, ask students, "Are there amounts smaller than this one cup?" "If so, how do we measure them?" After students discuss with a partner, discuss as a full class, and then show students the smaller measuring cups ( $\frac{1}{4}$  cup,  $\frac{1}{2}$  cup, etc).

To further illustrate, use a number line and show the space between 0 and 1. Ask, "What numbers exist in the space between 0 and 1 on the number line?"

Introduce the essential question: "How do we describe numbers smaller than one?"

## Explore

Match each student with a partner and pass out a set of number strips ( $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{3}{4}$ , and blank) to each pair. Pass out a copy of the What's Between Zero and One handout to each student. Students will use the number strips to explore the questions on the first page of the handout:

- How many pieces make a whole?
- How do we represent just one piece of this?
- How would we represent three pieces of this?

Next, tell students that they will be creating and labeling their own number strip for  $\frac{1}{4}$ . Have them turn to the second page of their handout and answer the questions in the top section. As students work, walk around the room asking guiding questions as needed, such as:

- Are the pieces equal sizes? (To make them equal, students can fold the paper in half, and then in half again.)
- How many pieces or parts do you have? (There should be 4.)

### Important Note

DO NOT show students what to do, but ask the above questions to help them analyze their designs.

## Explain

Have students complete a series of [Think-Pair-Share](#) activities using the table on the second page of their handout as a graphic organizer. Guide students as they think about the following questions, discuss with a partner, and then discuss as a class.

1. Looking back at your fraction strips, what does the bottom number represent? (Answer: The denominator is the bottom number, and it represents how many parts make a whole.)
2. Looking back at your fraction strips, what does the top number represent? (Answer: The numerator is the top number, and it represents how many parts there are.)
3. What are some times when we would want to represent part of a whole number?

For questions 1 and 2, explain to students that the bottom number is called the "denominator" and the top number is called the "numerator." Write a class definition for both terms.

Ask students to work independently to describe the fraction  $\frac{1}{2}$ . First, they should draw a bar model of  $\frac{1}{2}$ , and then they should record their ideas about the numerator and denominator. Have students share their ideas with a partner and then share with the whole class.

## Extend

Explain to students that sometimes fractions represent part of a whole, but they can also represent part of a set.

Give each student an individual (snack size) bag of colored candy. In pairs, have them brainstorm ways they could use fractions to describe the different colors in the package.

For example, if the package contains 17 total candies and 5 are red, then the fraction of the package that is red is  $\frac{5}{17}$ .

# Evaluate

Have students share their findings from the candy activity with the class and revise the definitions of "denominator" and "numerator."

Example Definitions:

- Denominator. "How many are there altogether." "How many pieces are in the whole group." "How many things it takes to make it whole."
- Numerator. "How many pieces are one type." "How many pieces are like each other."
